

HandDrawn

Version: RC1

Platforms: OSX, Windows

Size: (Approximately) 600 MBs

Type: Binary (*.APP, *.EXE)

Overview

Picture this:

You're walking along and then all of the sudden, the dirt turns cyan. The trees turn pink (provided that they were green to begin with). King Krazy (spelled with a K) has invaded the lush and not-in-economic-deficit-y land of Canvas Creatures and is destroying the balance of the Color Wheel of Powerness, corrupting the land with negatized colors.

Fortunately, unlike in other stories, the Canvas Creatures have planned ahead and made a good stab at their security system. Nonetheless, King Krazy did his homework too and through means I honestly haven't come up with yet, he designates Reverse Zones throughout the land of the Great Paper. If given enough time, he plans on turning the world to its negative colors forever, causing a rupture in the atmosphere which will probably turn the world evil. (Funny how it always works like that, huh?)

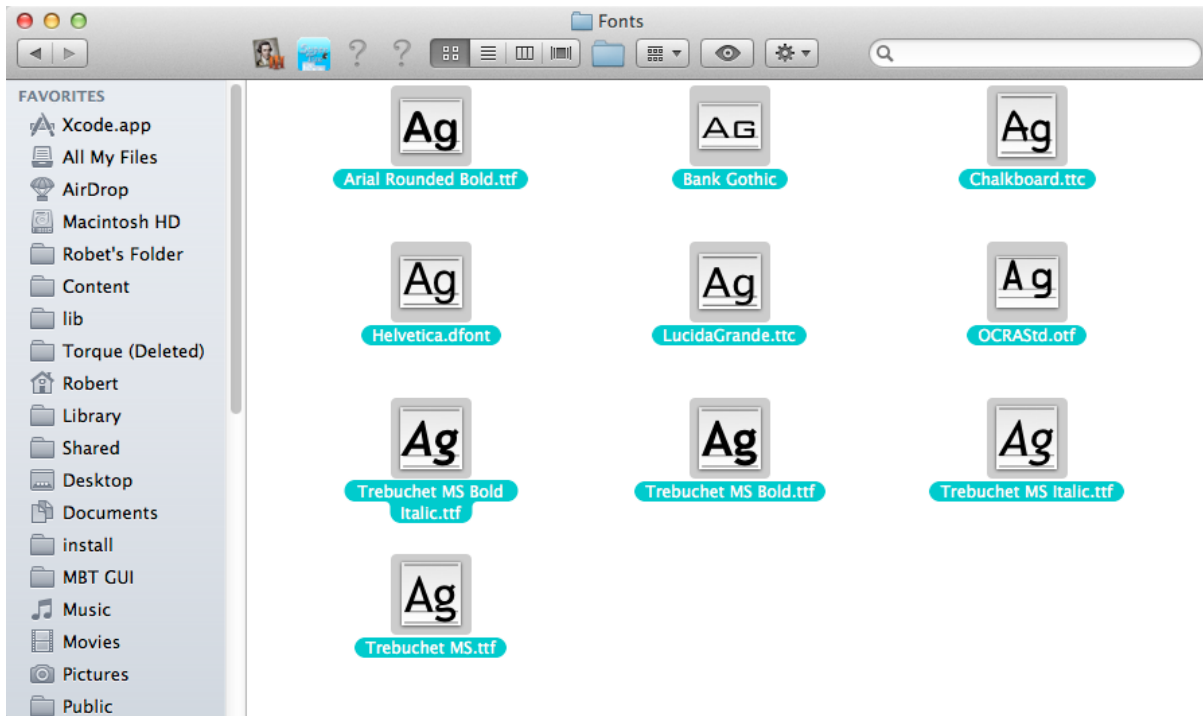

Never fear: Agent 3 did not sign on to be murdered by a giant rupture in a void. In order to stop this terrible calamity, you must help Agent 3 stop the evil king and bring him to justice for his crimes against the natural laws of the universe... and the spelling of "crazy"! And by "help", I mean, "control his every move". And yes, "negatized" is a word. Look it up in your copy of "Words That Don't Exist".

Installation

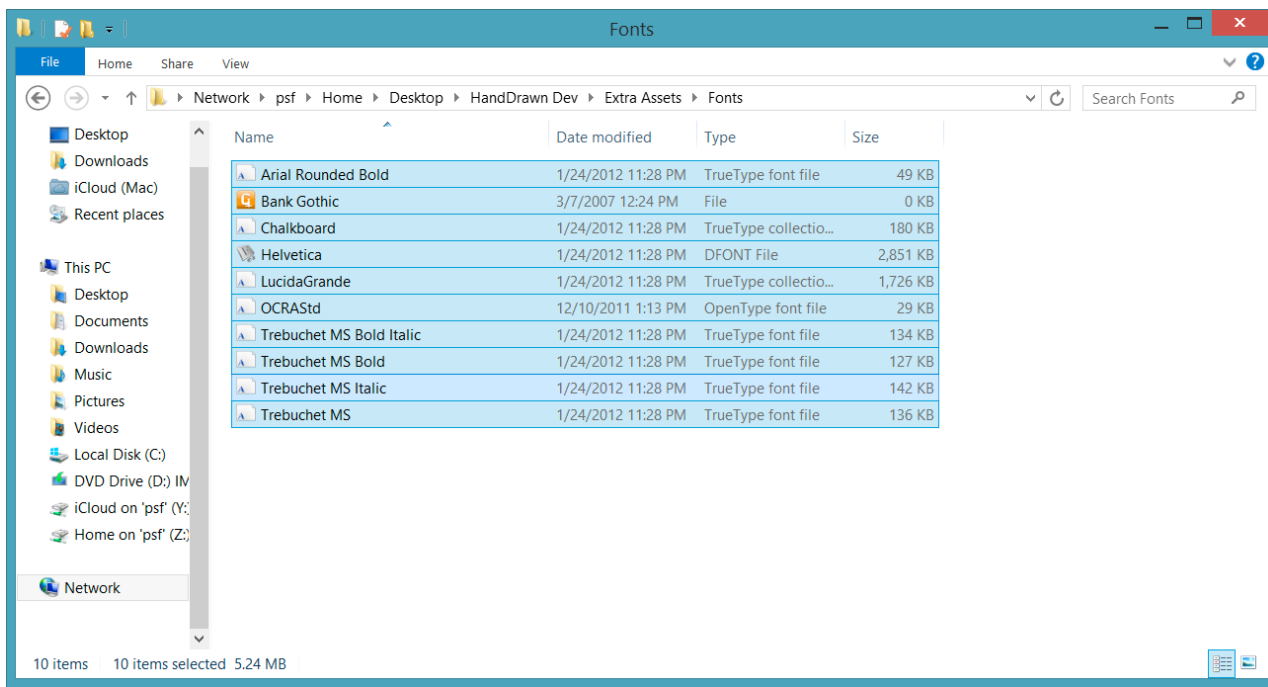

The game itself need only be downloaded and unzipped (Windows) or opened as a disk image (Mac). In order for HandDrawn to properly function, though, you may need to install the fonts in the "Extra Assets" directory. Macs will come with these fonts pre-installed, but if you're running off of Windows, you'll probably need the extras to be added! It will probably be a bit annoying for you to have to do each one by one, so just use **CTRL + A** (Windows) or **Command + A** (Mac) to select all fonts in the folder. Your screen should look like this, depending on the operating system you use—Mac or Windows.

NOTE: This is a one-time installation. Once you do this, unless they're uninstalled from your system, you will no longer need to do this step with every version.

Mac:

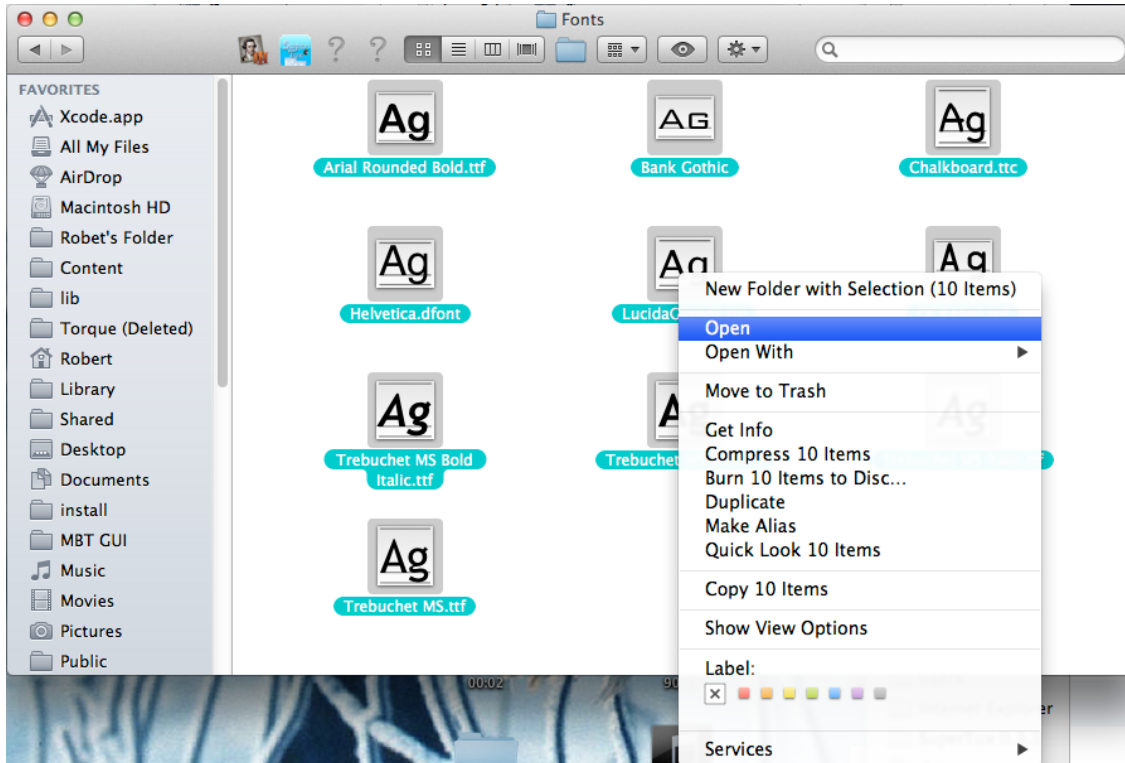

Windows:

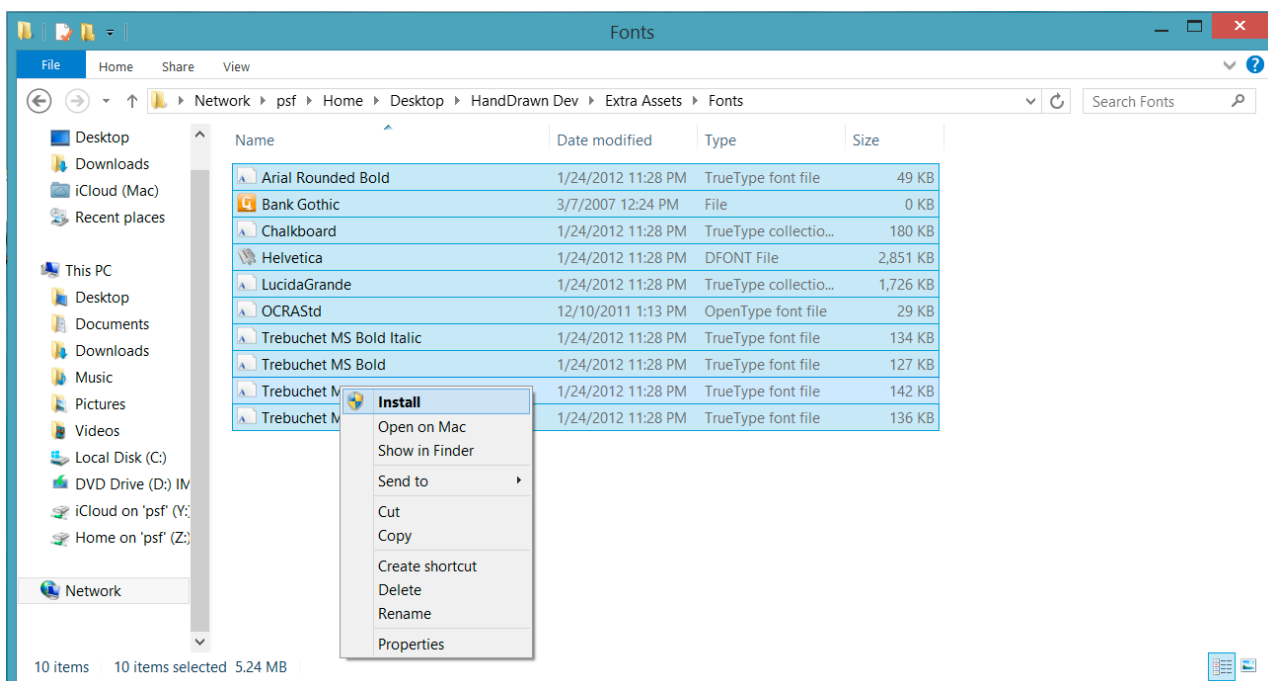

Then, you need to control-click on the files. On mac, you can press “Command + O” or do this:

(After control-clicking, you need to select “Open”)

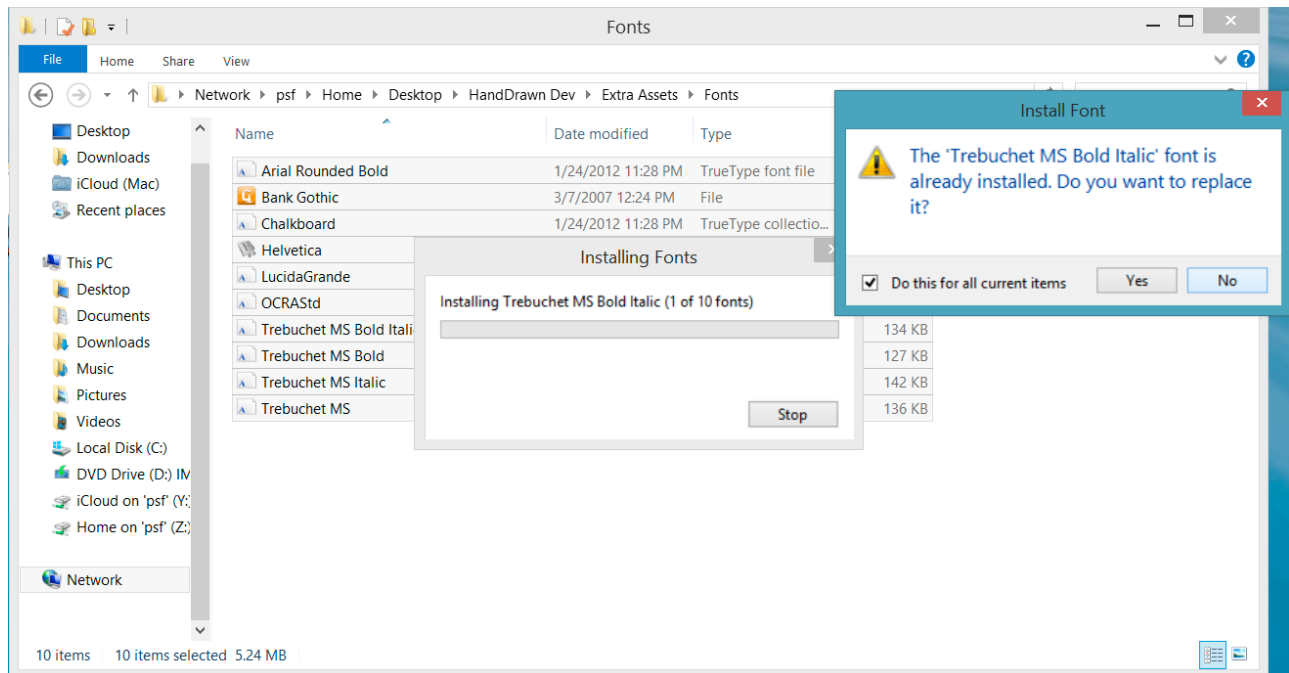

If you're on Windows: After control-clicking, you need to select “Instal”.

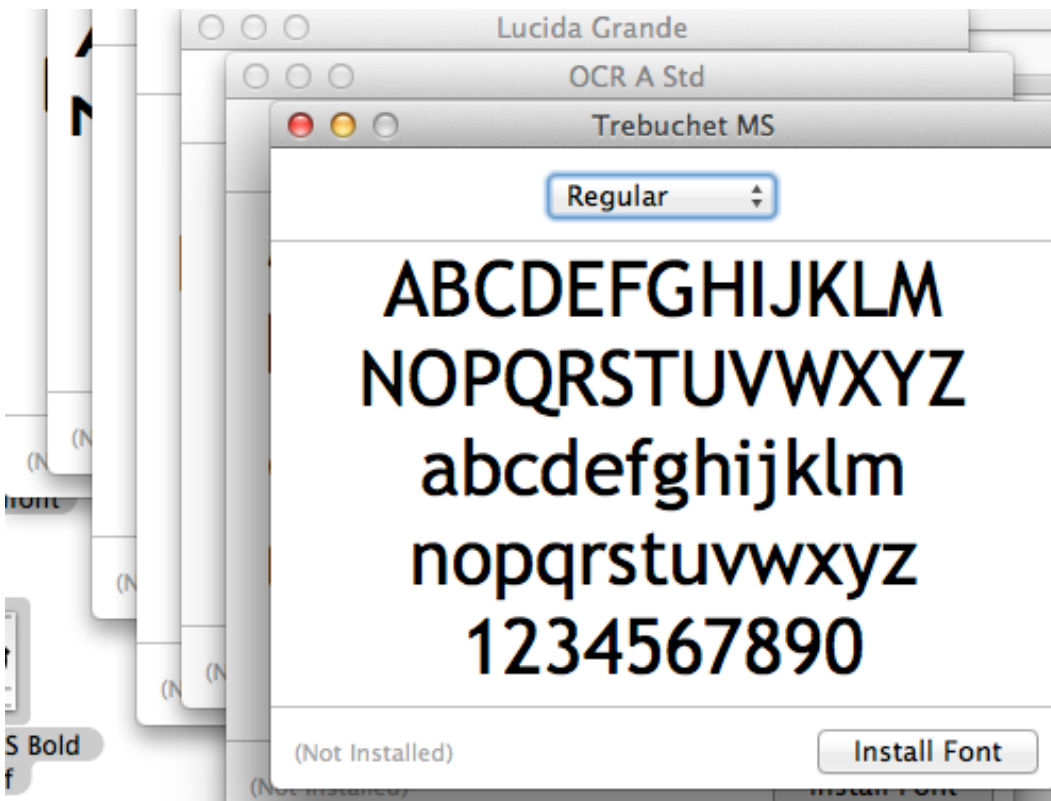

After doing this...

Windows: Install the fonts as directed. If you see a prompt:

Select “Do this for all current items” and press No. It may give you other errors, but ignore those. They are not important. Unless it tells you that a diplodocus is about to crash into your house. Yeah, that’d be pretty important.

Mac users have only one more step:

With each window, press “install font”.

And you're done!

Troubleshooting

Coming soon. If you see any problems, please report them on [HandDrawn's Blog](#) in the comments section in whatever version you're using. For example, if you are using RC1, please write the comment in the the post "[HandDrawn, Release Candidate, 1 is Here!](#)" prefixed with "BUG:".

Thanks!
